Global Humanitarian Organization

erwin
the data governance company

Sandhill

Achieving operational efficiency through **metadata-driven automation**

Client Profile

One of the world's largest humanitarian organizations with millions of members and volunteers operating in more 188 countries. It helps tens of millions of people around the world each year and cares for local communities in Australia and Asia Pacific.

Results

By implementing erwin Mapping Manager, the customer achieved significant time savings and was able to scan and store metadata and data dictionaries in a central repository.

Challenge

The organization was dealing with confusion and complexity in data mapping across several releases, impacting source system changes. And its business definitions and data dictionaries across IT systems were not stored in a central repository.

The customer needed a solution to standardize the pre-ETL data mapping process to enable savings and to make the data integration process more efficient.

Solution

The customer used erwin Mapping Manager to standardize the pre-ETL data mapping process. The purpose-built solution manages data integration mapping through the change and release process.

erwin Mapping Manager allowed the organization to scan and store metadata and data dictionaries in a central repository, as well as manage the business definitions and data dictionary for legacy systems contributing data to the enterprise data warehouse. Additionally, code set and reference data governance was enabled.

The organization achieved significant time savings from managing mappings, code sets, reference data and data validation rules using MS Excel files and removing all the management problems associated with sharing file-based data throughout the organization.

- > ROI achieved within the first 12 months

- > Time savings realized across all IT development and cross-functional testing teams, easily managing mappings, code sets, reference data and data validation rules

- > Data mappings easily created using drag-and-drop feature
